

Real Estate CRM

Complete End-to-End User Guidance & Platform Operations Manual

Application Name:	Real Estate CRM
Target Audience:	Super Administrators, System Administrators, Sales Representatives
Repository:	https://github.com/patturajan045/real-estate-crm
Cloud Deployment:	Render Production Cloud (WSGI / Unicorn)
Release Version:	2.0 Production Release

Welcome to Real Estate CRM

Real Estate CRM is an enterprise-grade customer relationship and inventory management system designed specifically for real estate developers, property brokerages, and high-performing sales teams. This guide provides comprehensive instructions for executing daily sales operations, managing customer prospect pipelines, reserving property units with atomic concurrency protection, collaborating via in-app notifications, and managing the platform dynamically without touching code.

Role	Email	Username	Password	Scope
Super Admin	superadmin@crm.com	Super Administrator	admin123	Full System + Exclusive CMS
Admin	admin@crm.com	System Administrator	admin123	Inventory, Team, Leads, Sales
Sales Employee	john.sales@crm.com	John Sales	sales123	Assigned Leads, Bookings

1. Getting Started: Access, Dual Login & Security

Universal Dual Login: Users can sign into their CRM portal using either their **registered email address** (e.g. superadmin@crm.com) OR their **Username / Display Name** (e.g. Super Administrator, System Administrator, John Sales). Matching is case-insensitive, allowing agents to log in naturally without syntax friction.

Password Visibility Toggle: Password fields feature an interactive eye icon button () allowing users to verify typed credentials before submission.

Self-Service Registration: New sales agents can register via the /register portal. By administrative security policy, self-registered accounts are automatically provisioned with the **Sales Employee** role. Role elevation to Admin or Super Admin is strictly controlled by existing management in the Team User Directory.

2. Design System & Global Navigation

The interface incorporates modern UX patterns optimized for productivity:

- **Left-Aligned Collapsible Sidebar:** Click the toggle button located in the sidebar header to toggle between the full sidebar (260px) and a compact icon-only mode (72px). The sidebar state is remembered automatically across page navigation.
- **Architectural Outline Action Buttons:** Action buttons feature transparent backgrounds with colored borders and text (e.g. blue for primary actions, emerald for bookings, rose for cancellations), preserving visual hierarchy.
- **Clean Input Fields:** Forms feature single leading icons and no intrusive placeholder text.
- **Enhanced jQuery DataTables:** Tables support instant multi-column search, column sorting, and custom pagination with perfectly aligned 'Show entries' select chevrons.

3. Real-Time Sales & Inventory Dashboard (/dashboard)

The Dashboard provides an immediate live overview of company performance, calculated directly from MongoDB:

Widget / Section	Description & Business Value
Real-Time KPI Cards	Live counts of Total Leads, Available Inventory Units, Pending/Urgent Follow-ups, and Total Confirmed Agreement Revenue (\$).
Pipeline Distribution Chart	Visual bar chart showing prospect volume across all 7 pipeline stages, identifying bottlenecks in the sales funnel.
Inventory Donut Chart	Real-time breakdown of unit inventory status (Available, Blocked, Booked, Sold).
Urgent Follow-ups Table	Highlights customer follow-ups due today or overdue with quick-action modals to log call notes directly.
Recent Bookings Feed	Chronological stream of the latest confirmed reservations, showing customer name, unit number, agreement value, and agent.

4. Lead Pipeline Management (/leads)

The Lead Management module enables sales teams to nurture prospects from first inquiry to closed contract:

- **7 Pipeline Stages:**

1. **New:** Fresh uncontacted lead from website or campaign.
2. **Contacted:** Initial phone call or email discussion conducted.
3. **Site Visit:** In-person property walk-through scheduled or completed.
4. **Interested:** Customer actively considering specific units.
5. **Negotiation:** Financial proposals, payment schedules, or terms under discussion.
6. **Booked:** Unit selected and formal reservation agreement executed.
7. **Lost:** Lead disengaged or selected alternative development.

- **Stage Filter Pills:** Clickable pills at the top of the table allow instantaneous filtering by stage with live counts.

- **Activity Timeline Notes:** Click the notes icon () on any lead to view historical interaction logs and append new timestamped notes with next follow-up dates.

- **Direct 1-Click Booking Conversion:** Clicking 'Book Unit' on any lead opens the booking wizard pre-populated with the lead.

5. Property & Inventory Directory (/properties)

Inventory is organized in a clean 3-tier hierarchy accessible via tabbed navigation:

1. **Master Projects Tab:** Manage overarching developments (e.g. 'Azure Bay Residences'). Stores project city, address, builder, and construction status (*Planning, Under Construction, Ready to Move*).
2. **Buildings / Towers Tab:** Manage structural blocks or towers tied to a parent project (e.g. 'Pacific Tower' with 12 floors).
3. **Units Inventory Tab:** Real-time list of every marketable unit. Filters allow isolating units by Project, Building, Unit Type (1BHK–4BHK, Penthouse, Villa, Commercial), and Status (*Available, Blocked, Booked, Sold*). Available units feature a direct 'Book Unit' action button to initiate reservation.

6. Booking System & Double-Booking Protection (/bookings)

The Booking Engine creates binding reservation contracts connecting leads with units:

Executing a Reservation:

1. Click 'New Booking' and select the customer lead and property unit.
2. Enter the negotiated Agreement Value (\$), initial Booking Deposit (\$), and Payment Method (e.g. Bank Wire, Cheque).
3. Click 'Confirm Booking'. The system generates a unique contract code (e.g. BK-20260908-A9C3F1).
4. The unit status transitions atomically to **Booked** and the lead stage transitions to **Booked**.

Atomic Concurrency Protection: If two sales agents click 'Confirm Booking' on the same unit at the exact same moment, the database atomic guard guarantees that only the first request succeeds. The second agent is immediately shown a friendly SweetAlert2 message: 'Double booking prevented! Unit is no longer available.' Inventory is never corrupted.

Booking Cancellation: If a buyer withdraws, click 'Cancel Booking'. Enter the cancellation reason. The system logs the reason and automatically releases the unit status back to **Available** for other agents to sell.

7. In-App Notification Center

Located in the top header bar, the Notification Bell () provides real-time alerts:

- **Automatic Task Alerts:** Whenever a manager assigns a lead or schedules a follow-up date, the assigned sales rep receives an immediate in-app notification: 'Follow-up assigned by [Manager Name] for [Customer Name]'.
- **Unread Badge Counter:** The red pill counter dynamically reflects unread tasks.
- **Quick Actions:** Click any notification item to navigate directly to the relevant record. Click 'Mark all read' to clear badges.

8. Team & User Administration (/users)

Super Admins and Admins can manage team accounts and permissions:

- **Adding Staff:** Click 'Add Team Member', enter their name, corporate email, phone, initial password, and role.
- **Deactivation-First Safety Policy:** Active staff cannot be accidentally deleted. Clicking the status button deactivates the account (isActive = False), immediately disabling their login access while keeping historical records intact.
- **Permanent Deletion with Lead Unassignment:** Once a user is deactivated, a red Delete button appears. Confirming deletion permanently deletes the user and safely sets all their assigned leads to unassigned (assignedTo = None), ensuring no customer leads are lost or orphaned.
- **Self-Deletion Guard:** Logged-in administrators cannot delete their own account.

9. Platform Settings & Dynamic CMS (/settings)

Super Admin Exclusivity: Only users with the **Super Admin** role can see and access Platform Settings. Regular Admins and Sales Employees are strictly barred with HTTP 403 Forbidden.

Dynamic UI Customization: Super Admins can customize all 48 system copy keys in real-time without modifying code:

- Brand titles and subtitles (sidebar and login header)
- Page headings, subheadings, and instructional notes across all modules
- Global sidebar navigation menu labels

Changes are saved in bulk to MongoDB and immediately update across the entire application for all users.

- **Restore Canonical Defaults:** Click 'Reset to Defaults' to roll back all dynamic copy to the factory defaults.

10. Troubleshooting & Operations FAQ

Question / Issue	Solution / Explanation
Cannot log in with email	Verify password or try logging in with your Username (e.g. 'Super Administrator'). Check if account was deactivated.
'Double booking prevented' error	Another sales agent confirmed a reservation on that unit milliseconds earlier. Select an alternative available unit.
Cannot see Platform Settings	Platform Settings is restricted exclusively to Super Admin. Contact your Super Administrator for company copy changes.
Session Expired warning	JWT tokens expire after 24 hours of inactivity. Simply log in again to receive a fresh secure session token.
Need to reassign leads after staff leaves	Deactivate and permanently delete the inactive staff member. Their leads automatically return to the unassigned pool.
